Before D: fit transforms + spline functions on A; choose initial threshold on B.
Freeze protocol after C development; start D with empty FIT192 and ROLE64.
Block k
Predict; request 1% labels
Assign fixed vector roles
End of block k + 1
Requested labels arrive
Fill FIT and CAL memories
FIT192: refit the head
8 gains + intercept
ROLE64: select thresholds
Age ≤ 50; ≥ 5 per class
Atomic valid update → first possible effect in block k + 2
Otherwise retain the previous head and both recent thresholds.
Paired traces: Frozen / B | Frozen / ROLE64 | FIT192 / B | FIT192 / ROLE64
